

These two specimens, however, are not the same as the ones described by the author in the preceding paper. The first is a small, dark, irregularly shaped fragment, and the second is a larger, more regular fragment, both of which are found in the same locality as the first specimen.

#### EXPERIMENTAL RESULTS

##### First experiment

The first experiment was conducted with the first specimen, which was a small, dark, irregularly shaped fragment. The results of this experiment are shown in Table I, which gives the values of the various parameters measured.

##### Second experiment

The second experiment was conducted with the second specimen, which was a larger, more regular fragment. The results of this experiment are shown in Table II, which gives the values of the various parameters measured. It is seen from these results that the second specimen exhibits a different behavior than the first specimen, particularly in the region of the maximum.

In the preceding paper, the author has shown that the behavior of the system is determined by the relative values of the various parameters. It is therefore of interest to see how these parameters vary with the different specimens.
